Empathy / interview-synthesis voice

How to use this: not a verbatim script — nobody is expected to read from it word-for-word, and realistically no one will stick to a script anyway. Study it well enough to explain each point in your own words, improvise if you're cut off, and answer a follow-up without freezing. If a question lands outside your section, give the short version and hand off by name — every presenter's script and the underlying `FIELD-NOTES.md` are in the same GitHub repo.

Field-visit recap (read this first if you missed a visit)

Everything in the deck traces back to these visits — this is the shared ground truth every presenter should know, whether or not you were there.

Tatay's cacao farm, Batbat (Tuesday, Aug 26). A 2.5-hectare farm run by Tatay alone — his children work in the cities — 100% organic, and he has health problems that limit how much heavy labor he can do himself. His farm used to produce about 500 kg of cacao a year (sold at ₱75–100/kg); this season it's close to **zero**, because of pests and disease. His own estimate of the farm's potential if pests were solved: **2,000 kg/year** — a 4× recovery, the biggest single lever we found anywhere. Cacao flowers year-round here, so the pest pressure never gets an off-season. On water, his framing was specific: the constraint is water *pressure*, not volume — he can't even estimate how many sprinklers his source could feed — and he's open to drip irrigation and rainwater collection. Important attribution point: Tatay described the problems and constraints; the pilot plan, the tools, and every proposed solution came from our own investigations, not from him.

What the farmers and Muravah told us directly. Pest control is their #1 problem — ahead of typhoon, which everyone called "unpredictable" and would rather we not chase. Post-harvest losses run 80–100% from pests/disease across the network, and 60% of pods die from careless handling alone (worse under Mayon ashfall). Farmer income is ₱2,000–10,000/month — below Bicol's ₱13,624/month poverty line for a family of five — the average farmer is about 50, and there's no succession pipeline; Muravah copes by recruiting BU Guinubatan students. Two hard rules for any solution: **organic only** (no synthetic fertilizers or pesticides, ever) and **no AI/robotics** ("not there yet," "AI is biased according to the natives") — low-tech and human-in-the-loop is a values position for them, not a budget issue. More labor doesn't raise profit, because pest pressure caps yield no matter how much work goes in.

Muravah Foundation / Mayon Gold. The cacao NGO anchoring all of this: cacao profits fund typhoon-proof homes and scholarships, heirloom native cacao interplanted with Pili and coconut, and a production-cycle data study already running across 500–1,000 farmers — which is where our pilot would live.

The processing facility. Their own #1 problem is power outages, but the line that matters for us: they're "sometimes out of supply for cacao." Farm-level pest losses upstream directly destabilize the factory

downstream — fixing the farms fixes two problems at once.

The other farms (Aug 27–28, now Extras slides). Tatay Aldavis's rice/dairy farm school (a different "Tatay" — it's a Bikol honorific for an elder, not a name) controls pests with herbal sprays and ducks that eat snails — proof organic pest control works in Bicol; plus a bamboo farm, stingless-bee honey producers, the Zambales agrivoltaics site (the ₱10M funding benchmark), and a youth agritourism program.

Your slides

You're the empathy / interview-synthesis voice. Your slides carry the human stakes of the deck — open it, state the core problems, land the emotional center, close it. Don't over-index on numbers; that's Masa's job. Your job is making sure the room feels like this is about a real person, not an abstract case study.

Slide 1 — Title.

Open energetically, you're setting the tone for the whole room. Say who we are and why we're credible: this isn't invented, it's built from real interviews with a cacao NGO (Muravah Foundation / Mayon Gold), a smallholder farmer (Tatay, in the Batbat area), a processing facility, and site visits across Bicol. The slide carries the **Team BEE** credit and the University of Tsukuba emblem on the right. State the thesis out loud: *"every solution we propose already works somewhere in Bicol — our job is showing how to bring it to cacao."* Keep this under 30 seconds.

Slide 3 — Our probes exposed these problems.

No solutions yet, problems only.

- Pest control is named problem #1 overall by Muravah — ahead of typhoon, transport, or post-harvest handling.
- Post-harvest loss runs **80–100% from pests/disease** network-wide, and near 100% from typhoon in a bad year. (We deliberately don't focus on typhoon — every source called it "unpredictable" and said they'd rather we fix pests/disease, which is tractable.)
- The processing facility told us it's "sometimes out of supply for cacao" — a farmer's lost pods becomes a factory's lost production run. This isn't just a farm-level problem.
- Separately, the facility's own #1 problem is **power outages**.
- Farmers earn **₱2,000–10,000/month**, average **~50 years old**, no government succession- training program.

Slide 10 — What we found at Tatay's farm.

This is the emotional low point right before the pivot to solutions — take your time. Pest and disease pressure, not typhoon, not transport, not land tenure, is what's driving Tatay's cacao yield to nearly zero. Cacao flowers **year-round**, so the pressure never lets up — there's no off-season where the farm gets a

break. If asked to name the disease: **Phytophthora**, almost certainly *Phytophthora palmivora* (the classic cacao black pod disease); also birds, and a viral disease affecting pod production. Keep this about Tatay as a person before moving into solutions.

Slide 16 — Thank you.

Close warmly and briefly. Read both lines as written: "Maraming salamat sa pakikinig" (Filipino) and "ご清聴ありがとうございました" (Japanese, roughly "thank you for your attention"), then "Thank you for listening" in English if it helps the room follow along. Credit the team by name: Nancy, Masa, Keisuke, Ria, Ash, Chow. Don't introduce new content here.
